## Amana HAC

The screenshot shows the Amana HAC website. The top navigation bar includes the Amana logo, menu items like 'About Us', 'Products & Services', 'Resources', 'Support', 'Product Registration', 'Warranty Lookup', 'English', and a search icon. A 'Find a Dealer' button is also present. The main content area features a large image of an Amana S-Series air conditioner. To the left of the image, the text reads 'HIGH-EFFICIENCY AIR CONDITIONER' and 'Amana® brand S-Series.' Below this, a short paragraph describes the system's quality and size. A 'Learn more' button is located at the bottom left. On the right side of the page, there is a 'REQUEST AN APPOINTMENT ONLINE' section with a progress bar showing steps: ISSUE, DETAILS, CUSTOMER SCHEDULE, and CONFIRM. Below the progress bar is a dropdown menu labeled 'PLEASE SELECT YOUR ISSUE' with a 'Start here!' button underneath. The Amana logo is displayed at the bottom center, and a 'Book Online' button is at the bottom right.

## Partnerlink

The screenshot shows the PartnerLink website. The top navigation bar includes the PartnerLink logo, a search icon, a dropdown menu set to 'Amana', and a 'My Account' button. Below the navigation bar, there are several menu items: 'Home', 'InfoFinderPlus', 'Marketing Tools', 'Service Tools', 'System Performance Tools', 'Warranty & Support', and 'Distributor Applications'. The main content area features a large image of two Amana S-Series air conditioners. To the left of the image, the text reads 'Slim. Smart. Sound. Savings.' and 'Find useful resources to promote the new Amana S-Series and Amana Smart Thermostat.' To the right of the image, the text reads 'Amana S-Series' and 'Introducing the Amana brand S-Series and Smart Thermostat.' Below this text is a 'View Resources' button. The Amana logo is also visible in the top right corner of the main content area.

# Service manual

- All wiring diagrams, piping diagrams, system operation, and fault code analysis can be found in the service manual for the equipment.
- When troubleshooting a specific piece of equipment, it is always best to download the service manual specific to that piece of equipment
- This can be done with a computer using Daikin city or with a mobile device using the Tech Hub app.

Communication Testing & Troubleshooting

Emergency Mode

Replacing Inverter Board

- **Thermostat**

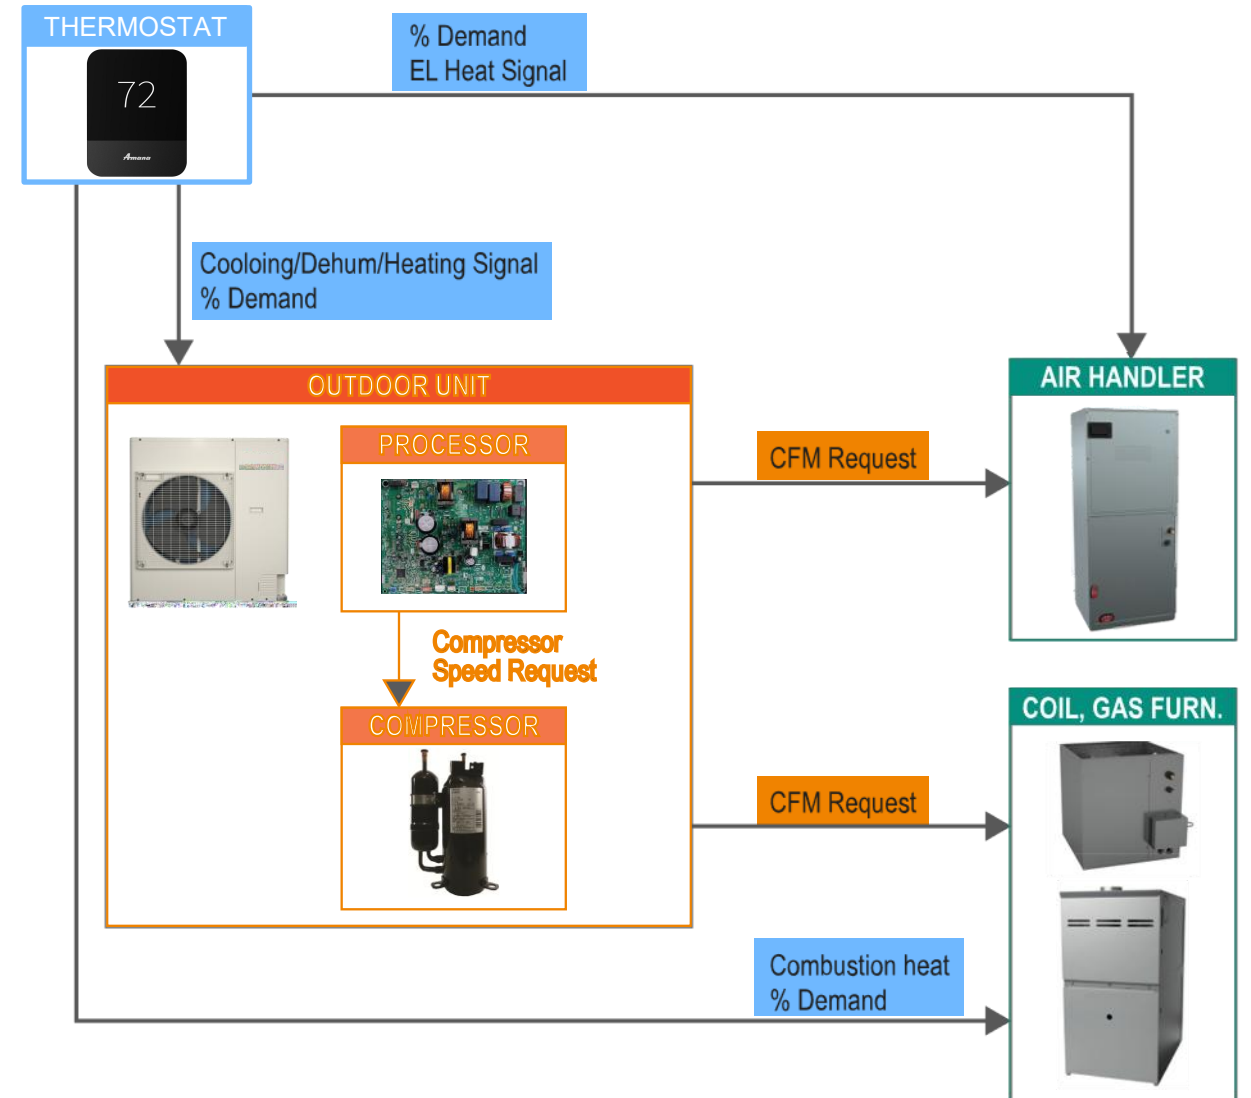

- Controls operation mode
- Sends compressor RPS demand to the ODU and IDU

- **Outdoor Unit**

- Controls compressor speed
- Sends CFM request to gas furnace/air handler

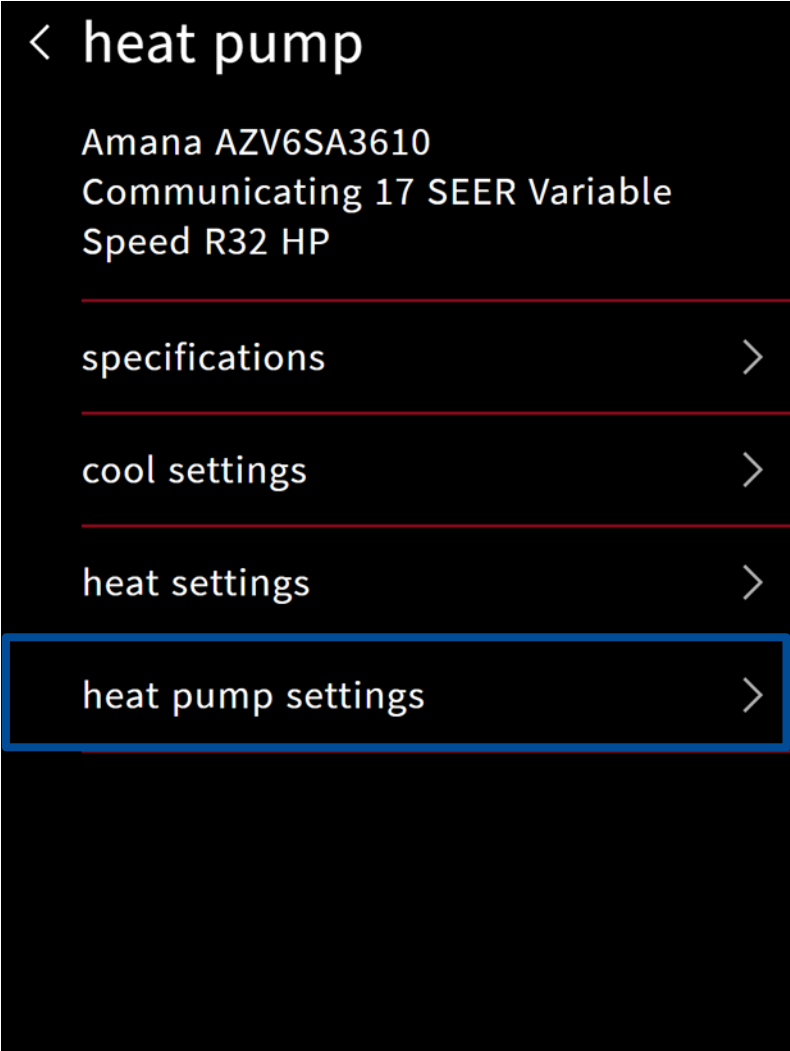

- **Air handler/EEV Coil/Gas furnace**

- Controls CFM

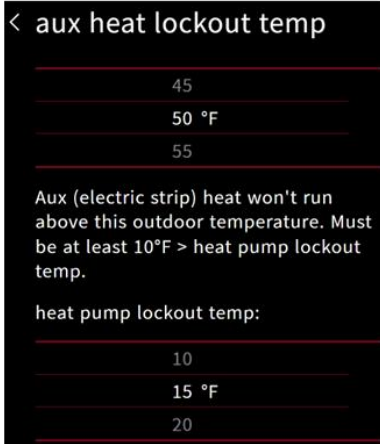

# Auxiliary Heat Logic

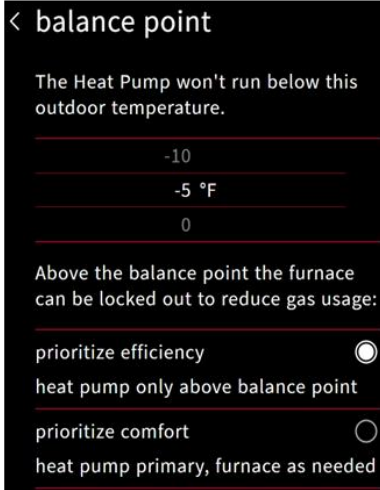

- Aux (Electric Strip Heat) and backup gas heat can engage above lockout temperature in the following conditions:
  - The space temperature is approximately 4° lower than the set point.
  - There is a demand between 110% - 200% from the system.
- For Dual Fuel operation only, you can select to prioritize efficiency or comfort
  - Selecting prioritize efficiency, the selected balance point will be a hard lockout.
    - Heat pump operation above balance point.
    - Furnace operation below balance point.
  - Selecting prioritize comfort will cause the system to run with the logic listed above.

## Electric Strip Heat

## Dual Fuel

# Outdoor Unit Fan Intermittent Operation

## Outline

- When crank case heater is ON, the system draws amperes through the inverters (INV) PCB and the INV. fin temperature may rise.
  - To protect the INV., the outdoor unit fan will operate intermittently to cool down the INV.

# Wiring Diagram: Double Fan HP Models (R-32 only)

# Pressure Sensor

- The pressure sensor senses the pressure in the line.
- The plug has 3 colored wires installed in pins 1, 3, and 4.

**Pin 1**

The **white wire** is the signal voltage being fed from the sensor back to the board.

**Pin 2**

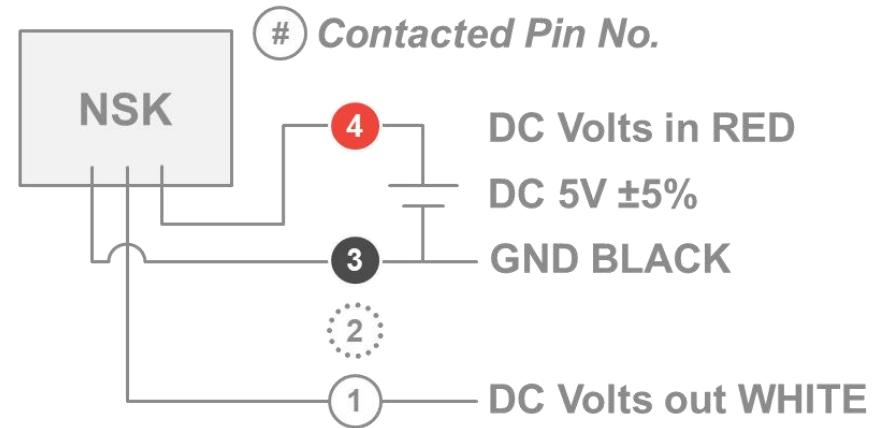

*Empty*

**Pin 3**

The **black wire** is the ground wire.

**Pin 4**

The **red wire** is the DC voltage that powers this sensor.

# Pressure Sensor

## Troubleshooting Steps

**Step 1:** Measure the suction and discharge pressure with no call from the thermostat.

- Pressure should be measured on the suction service valve.

**Step 2:** Find this number on the left side of the chart labeled “Detected Pressure PSIG”

- Follow your pressure line horizontally to the right until it hits the diagonal line.
- The chart is used to verify the correct operation of the pressure sensor.
- Once you hit the diagonal line traveling horizontally, drop straight down to read the expected output/signal voltage that should be seen from the sensor back to the board.

— Outdoor Unit 1.5 - 3.0 Ton, 2.0 Ton Enhanced & Double Fan ODU low pressure sensor

— Outdoor Unit 3.5 - 5.0 Ton, 3.0 – 4.0 Ton Enhanced, Double Fan ODU high pressure sensor & Indoor Unit

# Pressure Sensor

## Troubleshooting Steps

- Once this expected reading is known, set meter to DC volts, and measure the sensor output voltage at pins 1 and 3. (black and white)
- If the sensor output voltage doesn't match or come close to the voltage reading on the chart, replace the sensor.

**Measure  
Sensor  
Output**

**Incorrect  
Sensor  
Output**

## 3 Phase Fan Motor

- The first step is to measure voltage being supplied by the inverter board at plug.
  - Set meter to AC volts.
  - Set the controls to cool mode and adjust the set point temperature until the outdoor unit begins operation.
  - Ground the black meter lead and check all three terminals for AC voltage.
  - If voltage is present, proceed to motor winding check.

# 3 Phase Fan Motor

## Motor Winding Check

- Remove fan plug from the inverter board.
- Set meter to ohms.
- Measure the resistance between terminals 1-2, 1-3 and 2-3.
  - Terminal 1-Black
  - Terminal 2-White
  - Terminal 3- Red
- Resistance should be equal between all windings  $\pm 10\%$ .

# 3 Phase Fan Motor

## Voltages

- To ensure the sensor is operational, the technician can check between pins 1 and 4. You should read 5VDC.
- Once voltage is verified, mitigation mode can be tested utilizing the refrigerant leak test mode found in the communicating thermostat menus.

## PIN ASSIGN

PIN Number	Function	Wire Color	Customer PIN Label
1	Ground/Common	Black	C
2	Data+ (A)	White	1
3	Data-(B)	Green	2
4	V Supply	Red	5 V

# Troubleshoot Reversing Valve Coil Small Chassis & Double Fan Models

- To gain access to the coil and wiring, remove the access door and front panel.
- Voltage will spike from 120-340 VDC+ during shift.
  - The reversing valve coil (RVC) is energized in the cooling mode.
- If 10-24 VDC is not measured at the plug during operation:
  - Troubleshoot power being supplied by inverter PCB (may be a board issue).

**Resistance:  
555-615 ohms**

- If 10-24 VDC is present at the plug during operation and the reversing valve does not switch:
  - Inspect the wiring from the plug down to the reversing valve coil.
  - Turn off power. Verify voltage drop below 50VDC (C+/C-).
  - Remove plug from the PCB.
  - Set meter to ohms and test coil.
  - Resistance should read 585 ohms  $\pm$  5%.

# Troubleshoot Reversing Valve Coil Large Chassis

## Troubleshooting steps

- To gain access to the coil and wiring, remove the access door and front panel.
- If there is no 208/230 VAC at the plug:
  - Troubleshoot power being supplied by inverter PCB (may be a board issue).

# Troubleshoot Reversing Valve Coil Large Chassis

## Troubleshooting Steps

**Resistance:  
1.5K - 2.0K ohms**

- If 208/230 VAC is being sent to the coil during cooling operation, it should energize the reversing valve.
- If it doesn't energize it should be removed and tested.
  - Inspect the wiring from the plug down to the reversing valve coil.
  - Turn off power. Verify voltage drop below 50VDC (C+/C-).
  - Remove plug from the PCB.
  - Set meter to ohms and test coil.
  - Resistance should read between 1500-2000 ohms.

# Troubleshoot Reversing Valve Coil

# Discharging Inverter Board

- **WARNING!** Make sure to touch the earth ground terminal to release the static electricity from your body.
- Never contact the circuit board until it has been discharged.
- Generally, powering the system down for 10 minutes will allow the board to discharge naturally.
- Set meter to DC volts and place one lead on the solder pad for (C-) and one lead on the solder pad for (C+) to read the DC voltage.
- Once the residual DC voltage is 50 volts or less, the board is considered safe. (preferred voltage is 10 VDC or less)

# Thermistors

## Testing Temperature Thermistors

- Measure pipe temperature at the thermistor.
- Set meter to ohms and read across the two wires from the thermistor to be tested.
- The resistance and temperature measured, should align with the readings shown in the chart.

# Electronic Expansion Valve

- Allows precision metering by responding instantly and continuously.
- Sensors input demand to open and close allowing the correct amount of refrigerant according to load requirement.
- EEV motor head can be replaced without recovering the refrigerant.
- Target superheat
  - **Single Fan models (R-32 & R-410A)**
    - Cooling: 9°F (5°C) - IDU EEV Target SH
      - When outdoor air temp is less than 70°F (21°C) Target SH is 14°F (8°C).
      - Heating: 7°F (4°C) - ODU EEV
  - **Double Fan model (R-32)**
    - Cooling: 5.4-18°F (3-10°C) - IDU EEV Target SH
    - Heating: 1.8-9°F (1-5°C) IDU SC Control Target

# Electronic Expansion Valve

- Electronic expansion valves (EEV) are utilized in the CAPEA/ CHPEA indoor coils (IDC), AHVE/MBVK (Air handler) and the Outdoor unit.
- To check the resistance of the EEV coil, first disconnect power to the unit.
- Remove EEV Molex connector from the board and measure resistance between the different colored connector pins.
- Resistance readings should fall within the range listed in the service manual test procedures.

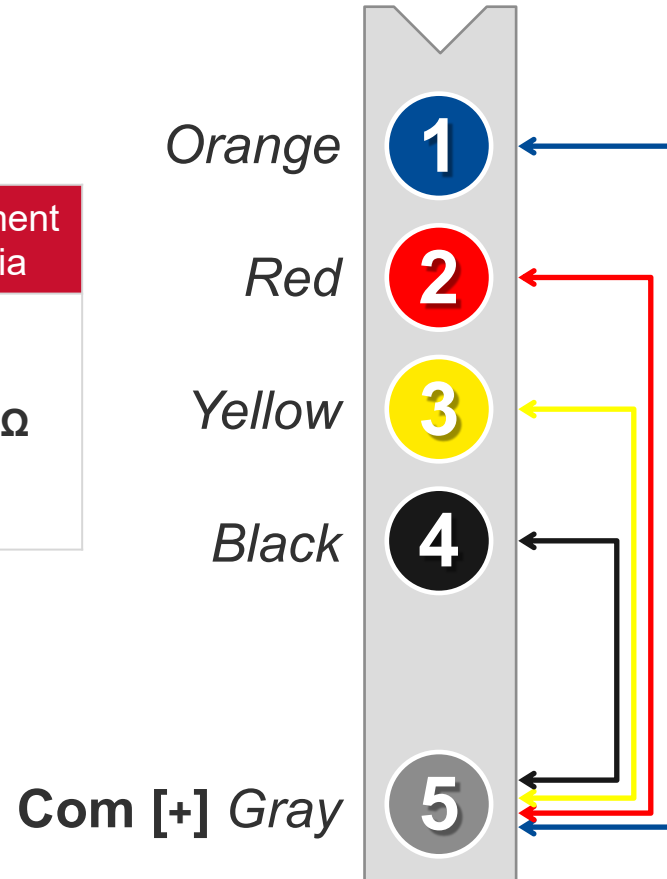

# Electronic Expansion Valve

- Set meter to ohms, and measure resistance between all pins to common. (gray)

# Electronic Expansion Valve

# Troubleshoot Outdoor Solenoid Valve

## Testing Solenoid Valve Coil Resistance

- If determined the solenoid valve coil is faulty it must be tested.
- Unplug solenoid valve from the PCB.
- Read resistance between the connector pins, and then make sure the resistance falls in the range of 1,480 to 1,820 Ω.
- If ohm/resistance is not within range, replace solenoid valve coil.

**Resistance:  
1.5k-1.8k  
ohms**

# Compressor

## Compressor Ground Test

- If a fuse, circuit breaker, or ground fault protective device has tripped, it's an indication that an electrical problem exists.
- Disconnect all power to the unit, and make sure all power legs are open.

# Compressor

## Compressor Ground Test

- Carefully remove the leads at the compressor terminals.
- Test for ground between compressor terminals and ground.
- If ground is indicated, replace the compressor.

# Compressor

## Insulation Resistance Test

- Carefully remove the leads at the compressor terminals.
- Set megohmmeter to 500V.
- Test for megaohms (M $\Omega$ ) between each compressor terminal and ground.
- If less, then 30(M $\Omega$ ) is indicated, replace the compressor.

Replacing Inverter Board

# Checking Duct Static

- HVAC equipment rely on the air flow inside of their system to properly intake and output air. The external static pressure (ESP) can verify the unit is performing as designed or can direct you to a problem within the system.
- Refer to your rating plate for the maximum ESP.
- Inspect duct sizing, duct insulation, filters, and zone damper positions.
- Incorrect external static pressure may cause
  - Excessive temperature rise
  - Motor stress
  - Duct stress
  - Reduced performance
  - Unwanted condensation
  - etc.

# Checking Duct Static

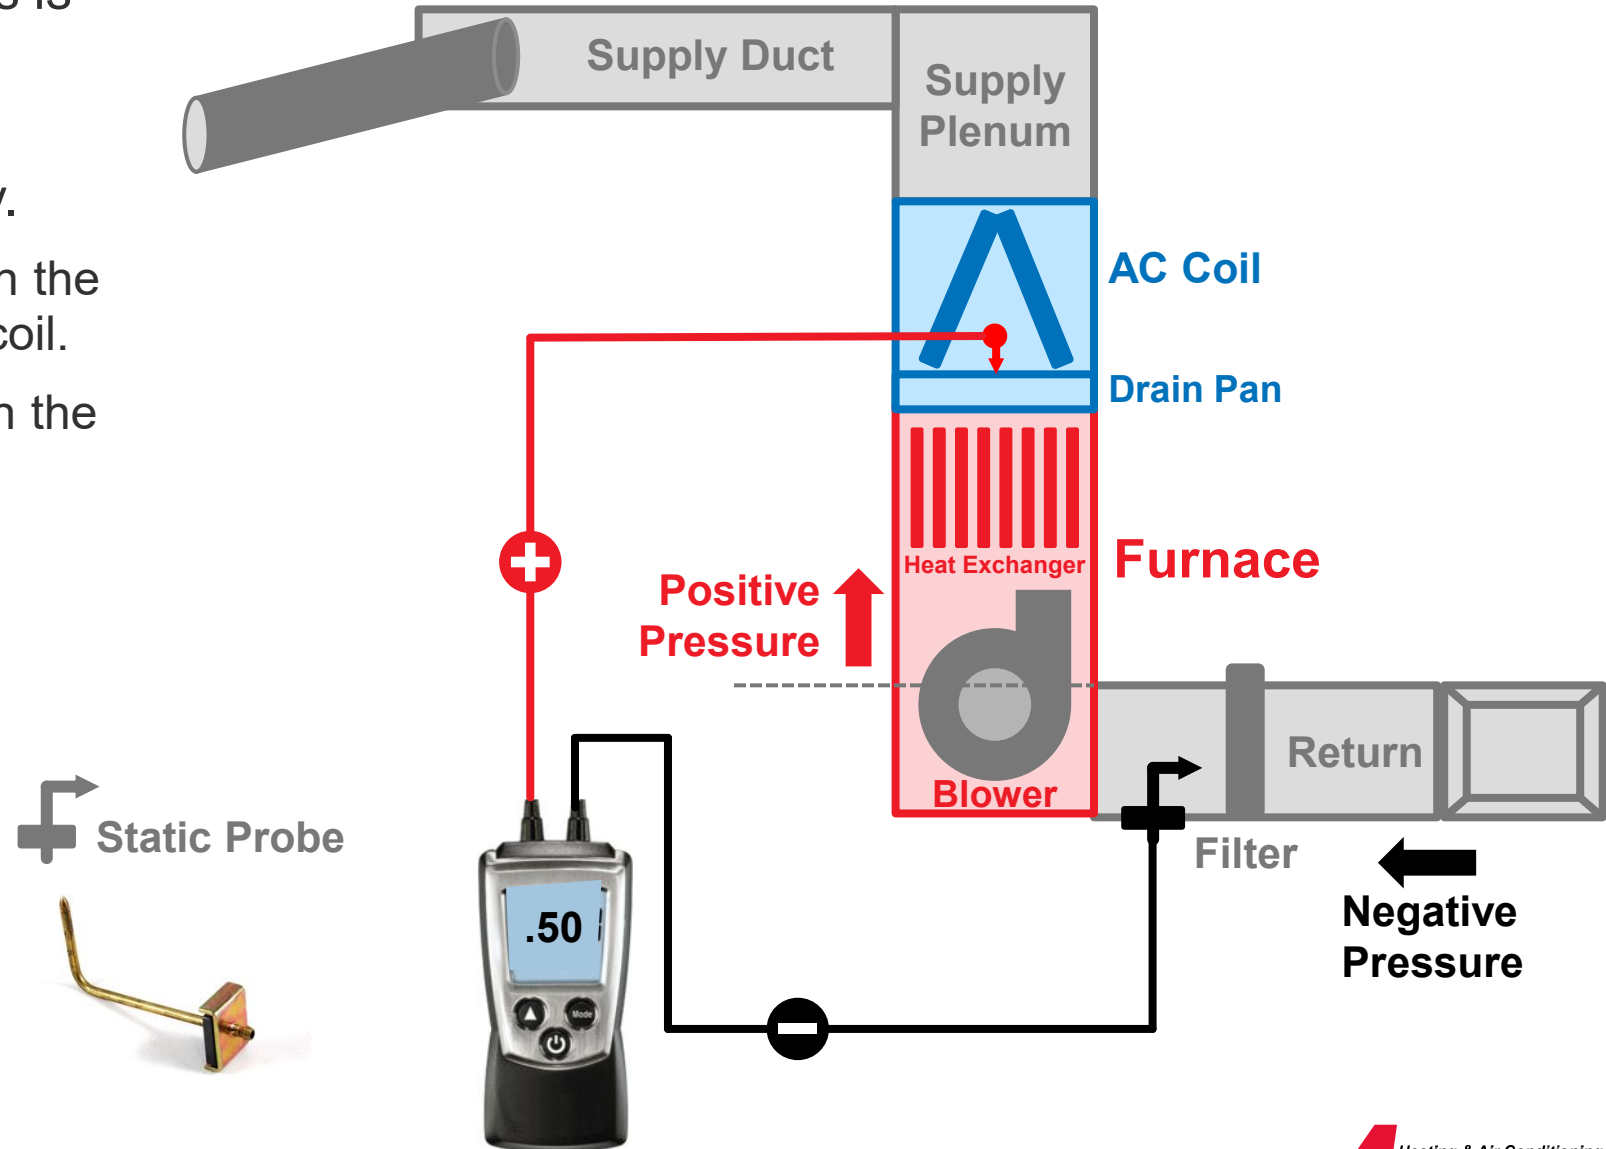

- The positive static is measured
  - **Furnace:**
    - At the supply outlet and must be read between the furnace and the cooling coil.
  - **Air handler/MBVK:**
    - At the supply outlet.
- The negative static is measured
  - **Furnace:**
    - At the return plenum and must be read between furnace the and filter.
  - **Air handler:**
    - At the return plenum and must be read between air hander and the filter.
  - **MBVK:**
    - Between the modular blower and the cased coil

**Caution: Be careful to not damage components within unit.**

# Static Pressure | Gas Furnace and AC Coil

- The design static of most furnaces is 0.5 inches water column.
- Use a manometer to measure the static pressure of the furnace only.
  - Supply side is measured between the heat exchanger and evaporator coil.
  - Return side is measured between the blower wheel and filter.

# Static Pressure | Single Piece Air Handler

- On a single piece air handler, the evaporator coil has been installed at the factory and is already considered in static pressure calculation.
- Use a manometer to measure the static pressure of the air handler only.
  - Measure static pressure of the supply duct at the outlet of the air handler.
  - Measure the static pressure of the return duct at the inlet of the air handler.

# Communication Considerations

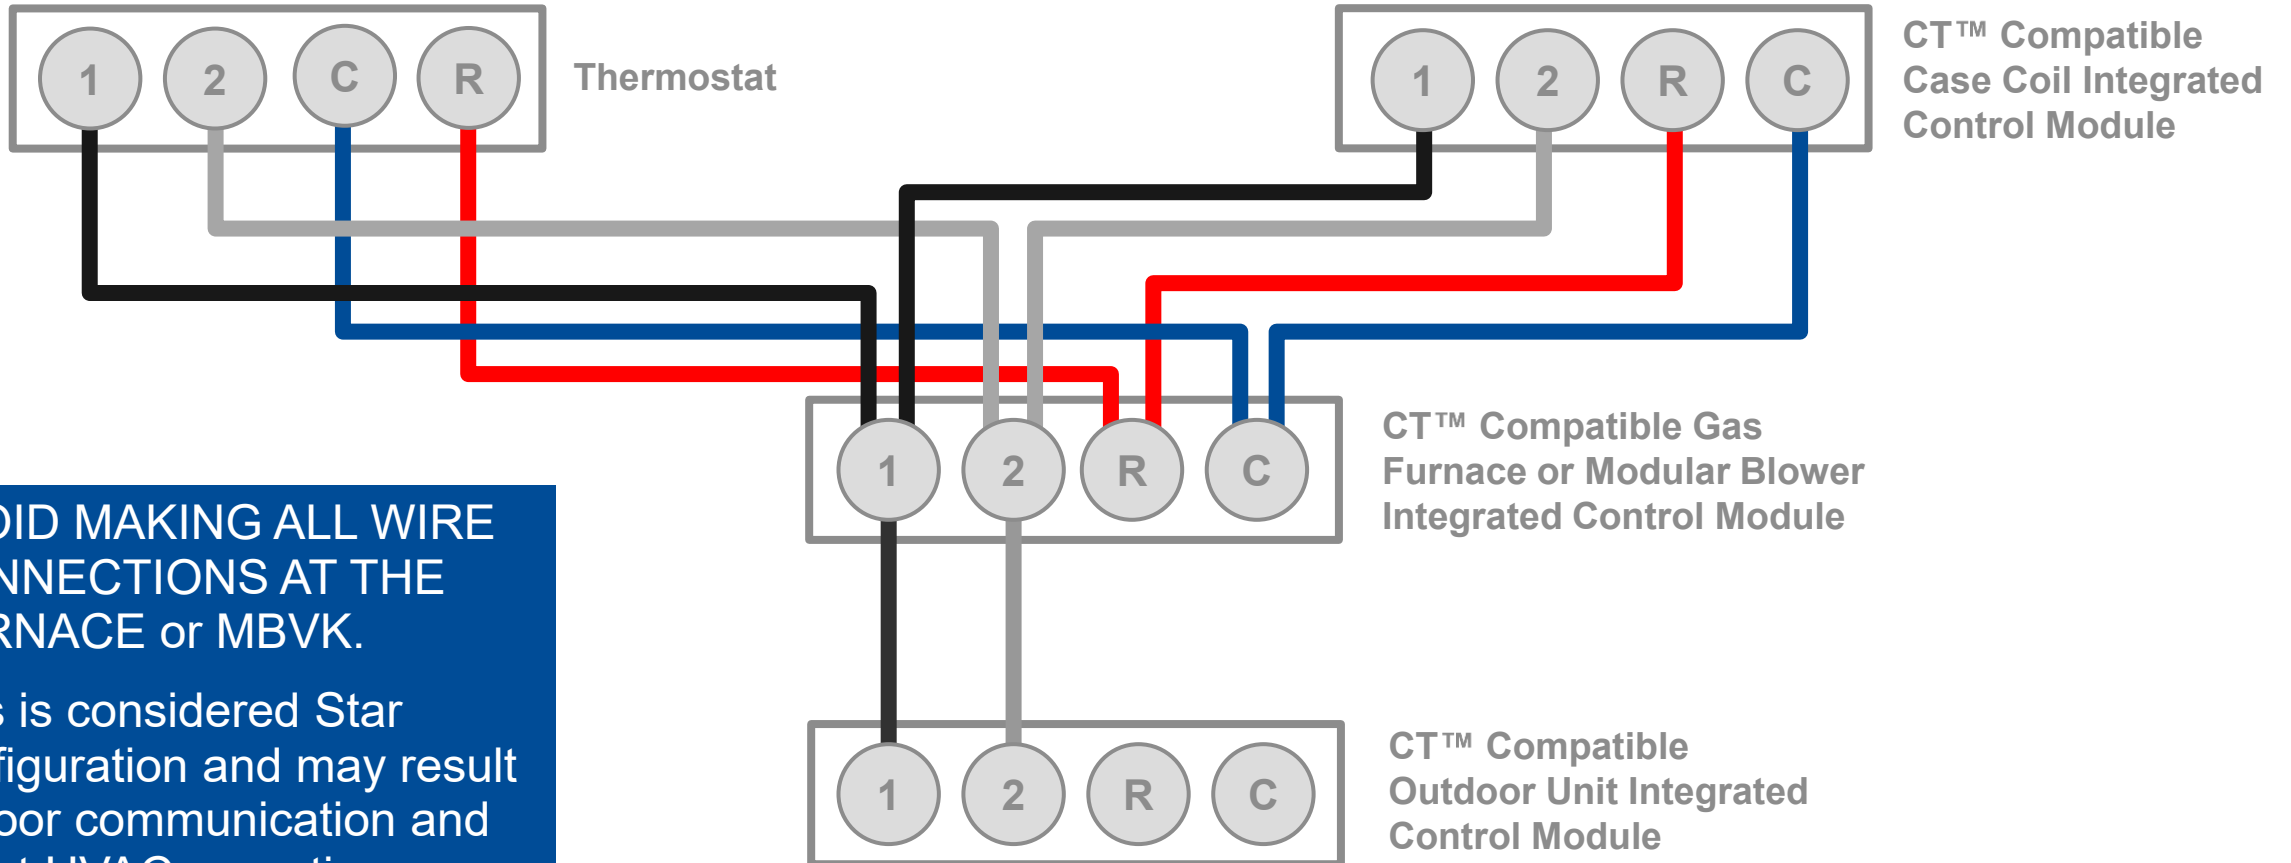

## Electrical Noise

- The inverter units should be well grounded so that potential effects of electrical noise from the inverter to surrounding equipment is minimal.
- When selecting an install location, keep recommended distances from home stereos, personal computers, solar panel control boxes, whole home generators, cable modems and internet routers, etc.

## INCORRECT Low Voltage Wiring

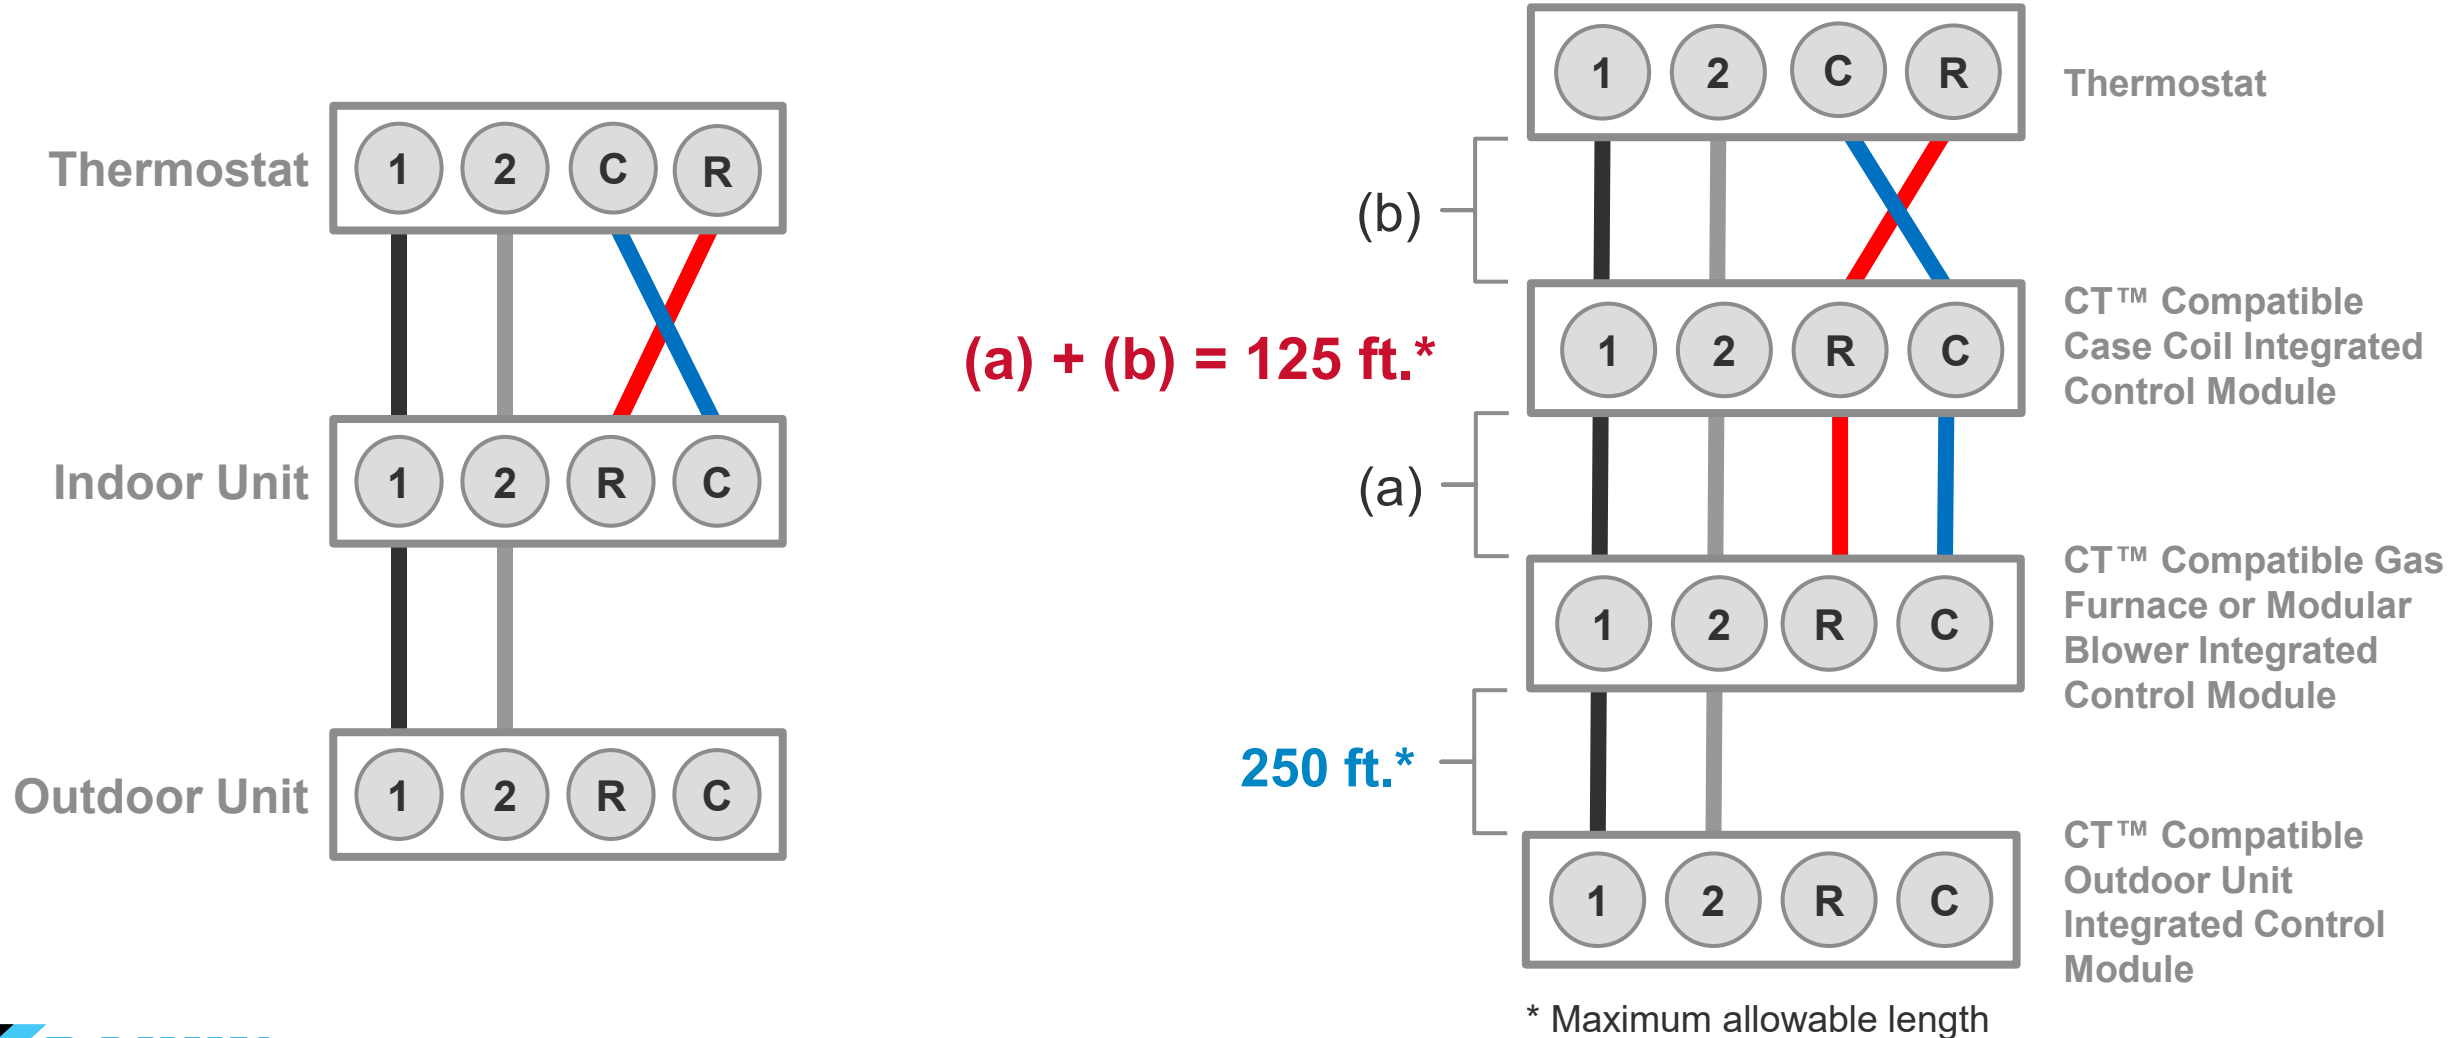

**AVOID MAKING ALL WIRE CONNECTIONS AT THE FURNACE or MBVK.**

This is considered Star configuration and may result in poor communication and affect HVAC operations.

# Wiring

## CORRECT Low Voltage Wiring

# Wiring

## Multiple Conductors

- Twist wires together prior to insertion in top the terminal block.
- Avoid using different wire size and type.
- Avoid inserting more than two wires into a terminal connection.

## Single Conductor

- Use a good quality wire nut to secure multiple wires and then make a single point connection to the terminal block.

**Good Wiring Practice Insures Low Resistance Connections!**

## Solid Conductor Tips

- Do not wrap extra conductors around the wiring jacket
- Only ground the wire on one end.
  - The preferred spot to ground is at the indoor unit.
- Another option to improve communication reliability is to mechanically twist two of the extra conductors together and place two under the Data 1 Terminal and two under Data 2 Terminal.

# Low Voltage Readings

Data 1 & Data 2 (Communication)

Volts DC

R & C (Power)

Volts AC

# Communication Troubleshooting

- If receiving improper communication after verifying proper wiring and connections, powering down the system and turning DS1 dip switches to the down position can improve communication.
  - Data 1 & 2 should measure
    - Amana Smart Stat 0.6-0.9VDC
    - Daikin One Plus 0.6VDC
  - Wait a few minutes and then power back up by starting with the outdoor unit, then the Indoor equipment.
  - It will take approximately 3 - 5 minutes for the HVAC system and all thermostats to configure.
- Use the controller to access the outdoor and indoor equipment error history menu to clear faults.

Small Chassis

Large Chassis

## DS7 Network Troubleshooting Switches Explained

- If network errors have occurred, there is a combination of dip switch settings that can be utilized to improve communication.
  - DS7 dip switches are located on the indoor PCB
  - DS1 dip switches are located on the outdoor board.
  - There is a table in the installation manual that shows the possible combinations.

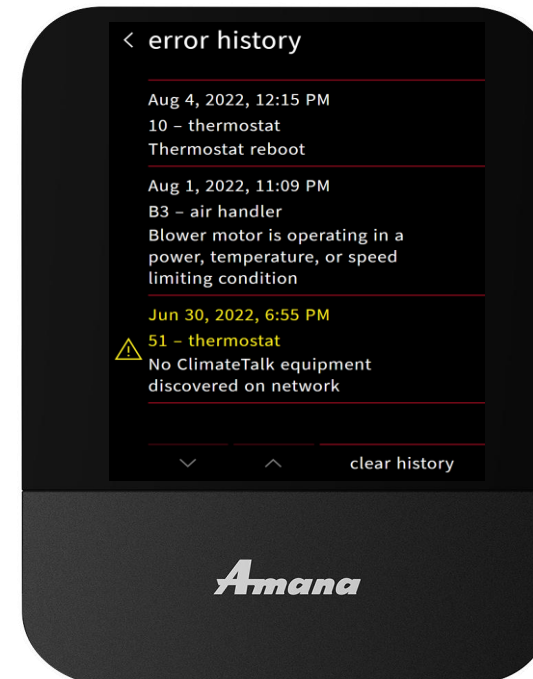

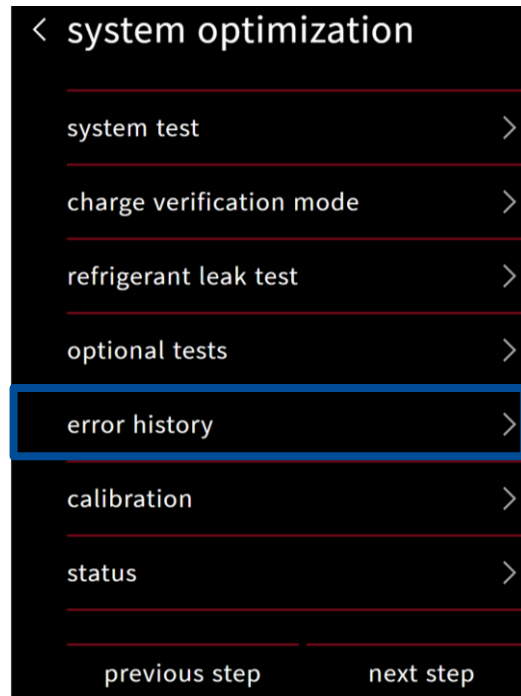

### Dip Switch Setting Combinations

Setting Combinations	DS1 on the outdoor unit control board	DS7 on the indoor unit control board
1*	(both) ON	(both) ON
2	(both) OFF	(both) ON
3	(both) ON	(both) OFF
4	(both) OFF	(both) OFF

(\* Default factory settings)

# Error History

- The error history menu stores errors from most recent to least recent.
  - 10 thermostat and 10 equipment error codes can be stored.
  - Each error entry includes an error code, the equipment type which generated the error, a brief error description and a timestamp.

# Cooling Emergency Mode

- Cooling emergency mode is to be used when communication between the indoor and outdoor units is not functioning properly and temporary cooling operation is required.
  - This mode enables the outdoor unit and indoor unit to run independently of each other.
- The compressor speed will automatically adjust based on the outdoor ambient temperature.
  - If ambient temperature is higher than 95°F, the outdoor unit can operate at 100% compressor speed. If ambient temperature is lower than 70°F, the unit will run at 50% compressor speed.
  - Between 95°F and 70°F, the compressor speed will adjust linearly as shown.

# Cooling Emergency Mode

## Steps to Initiate Emergency Cooling: Cased Coil (CAPE(A)\*/CHPE(A)\*/CAHEA

**Control wiring:** Remove The thermostat communication wirings (1,2, R and C) off all connected equipment (CAPE(A)\*/CHPE(A)\*/CAHEA, gas furnace/modular blower, outdoor unit and thermostat) from the communication terminals.

**Indoor coil:** DS-6 switch bank S-21 to ON, and S-22 to OFF.

## Steps to Initiate Emergency Cooling: Furnace

- Disconnect 4 pin plug and create a jumper to connect terminals R and G as shown in the image below.

# Cooling Emergency Mode

- During operation, the indoor unit will provide constant airflow.
- The indoor unit will continue to operate the EEV for refrigerant superheat control, and the compressor will cycle at the interval selected by switch bank DS-2.
- The coil PCB will display EE while system is in emergency mode.

# Heating Emergency Mode

## Steps to Initiate Emergency Heating: Cased Coil (CAPE(A)\*/CHPE(A)\*/CAHEA

**Control Wiring:** disconnect power to all units and remove thermostat wiring from the outdoor unit, furnace, and coil PCBs.

**Thermostat:** Install legacy thermostat to furnace PCB for temporary operation.

**Indoor Coil:** DS-6 Switch Bank S-21 to OFF, and S-22 to ON.

- The coil PCB will display EE while the system is in heating emergency mode.

## WARNING

Avoid contact with the charged area.

- Never touch the charged area before confirming that the residual voltage is 50 volts or less.
1. Shut down the power and leave the control box for **10 minutes**.
  2. Make sure to **touch the earth ground terminal to release the static electricity from your body** (to prevent failure of the PC board).
  3. Measure the residual voltage in the specified measurement position using a VOM while paying attention not to touch the charged area.
  4. Immediately after measuring the residual voltage, **disconnect the connectors of the outdoor unit's fan motor**. (If the fan blade rotates by strong wind blowing against it, the capacitor **will be charged**, causing the **danger of electrical shock**.)

**Read all warning labels before performing any service!**

<b>3 Error Decision Conditions</b> When required CFM exceeds maximum CFM limit of the indoor unit.  When a connected indoor unit is not EEV type.		Is the combination of outdoor and indoor units on the AHRI web site? NO → Replace to certified combination. YES → Make sure the airflow trim setting have not set to prohibited value.

# Scenario

## Troubleshooting D2

- What do we check?
  - ✓ Power supply (24v)
  - ✓ Low voltage wiring or connections (voltage is within range and connections are secure)
  - ✗ PCB (is not energized)
- What should we do?
  - ? Check the PCB fuse
  - ? Replace the PCB
- The PCB is replaced and a D0 occurs, why?
  - Did you populate the correct shared data on the new board utilizing the shared data loader?

# Scenario #3

---

## Troubleshooting D2 Recap

- To recap, we replaced the EEV PCB, verified all wiring is correct, then populated new data onto the PCB via Bluetooth Shared Data Loader.
  - Verify the thermostat shows the correct model numbers for all equipment.
  - Verify system is operational

### Troubleshooting

Scenario #1

Scenario #2

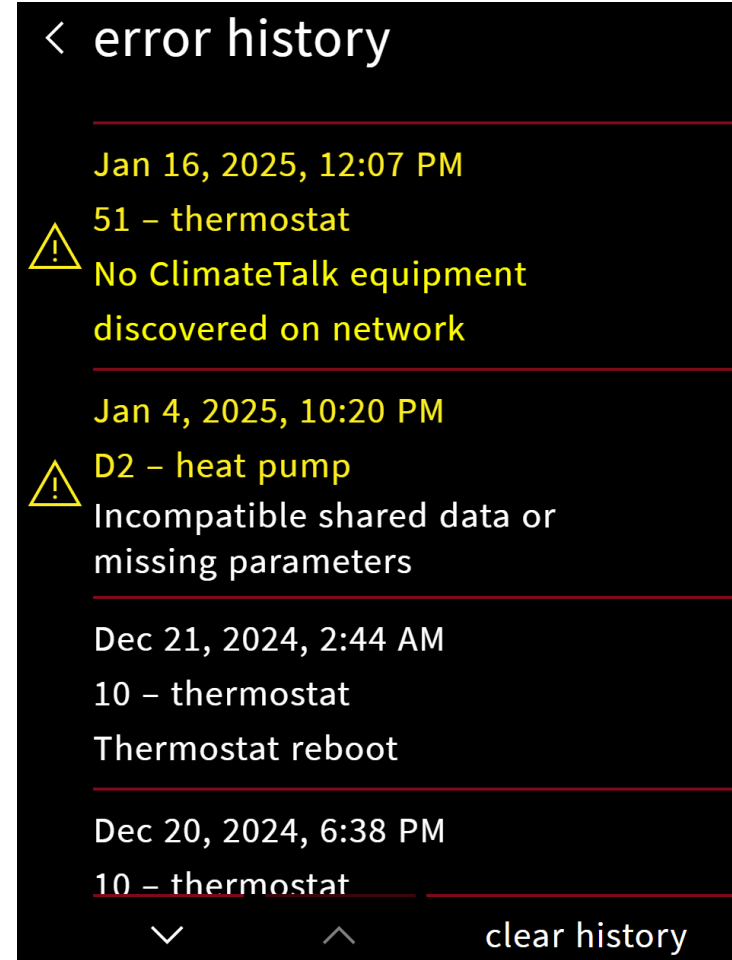

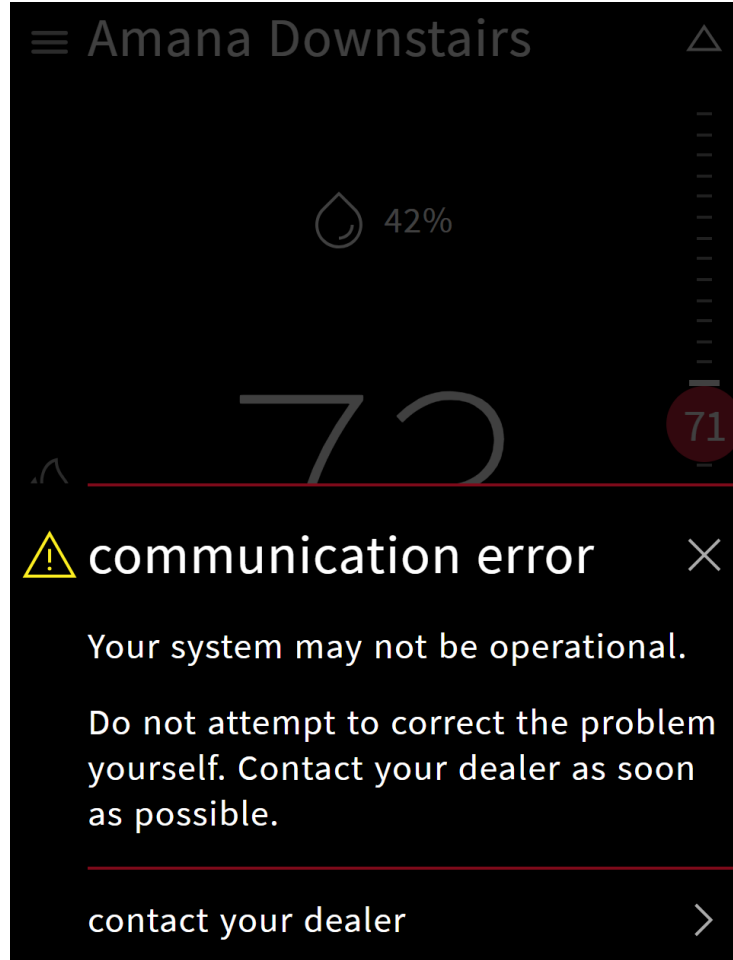

Scenario #3

Scenario #4

# Scenario #4

## Communication Error at Start-up

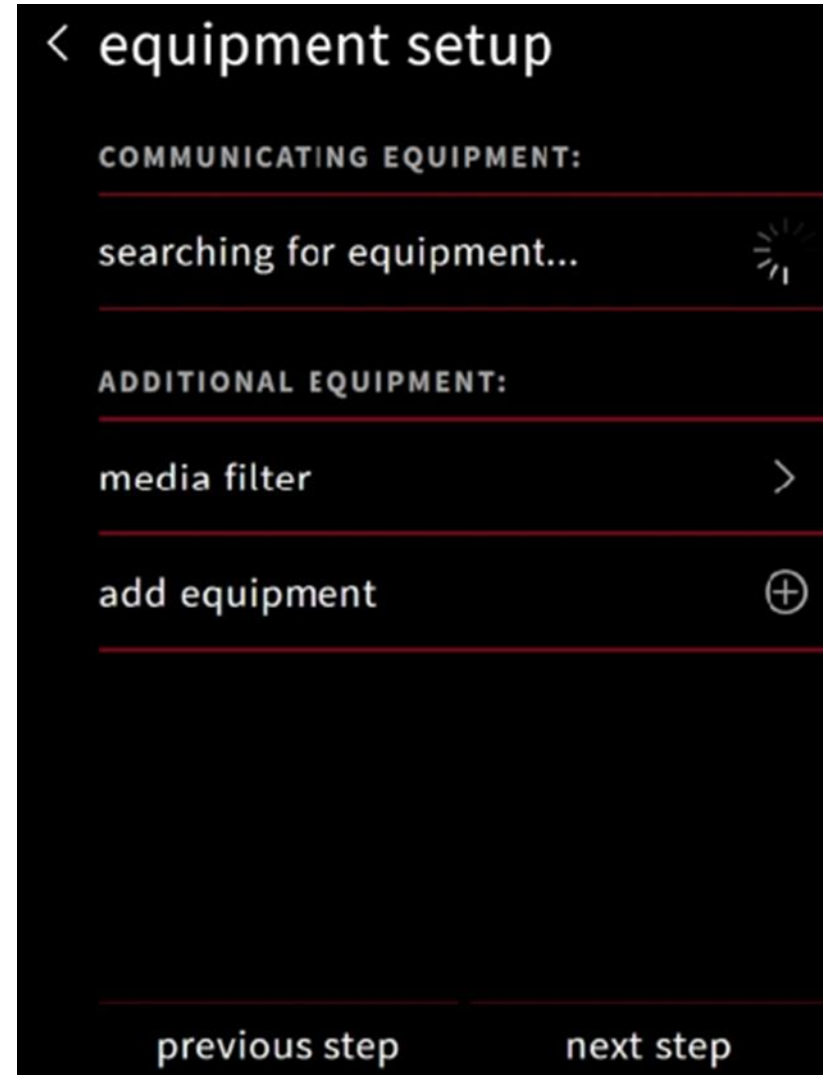

- During start-up, the installer finds a communication error on the thermostat. Troubleshoot and find the problem

# Scenario #4

## Communication Error at Start-up

- Does the thermostat find the equipment?
  - No.
- What should we check first?
  - Check wiring voltages and connection

# Scenario #4

## Communication Error at Start-up

- Do we notice any issues with the wiring connection between the furnace and the thermostat?
- If so, what is the issue?

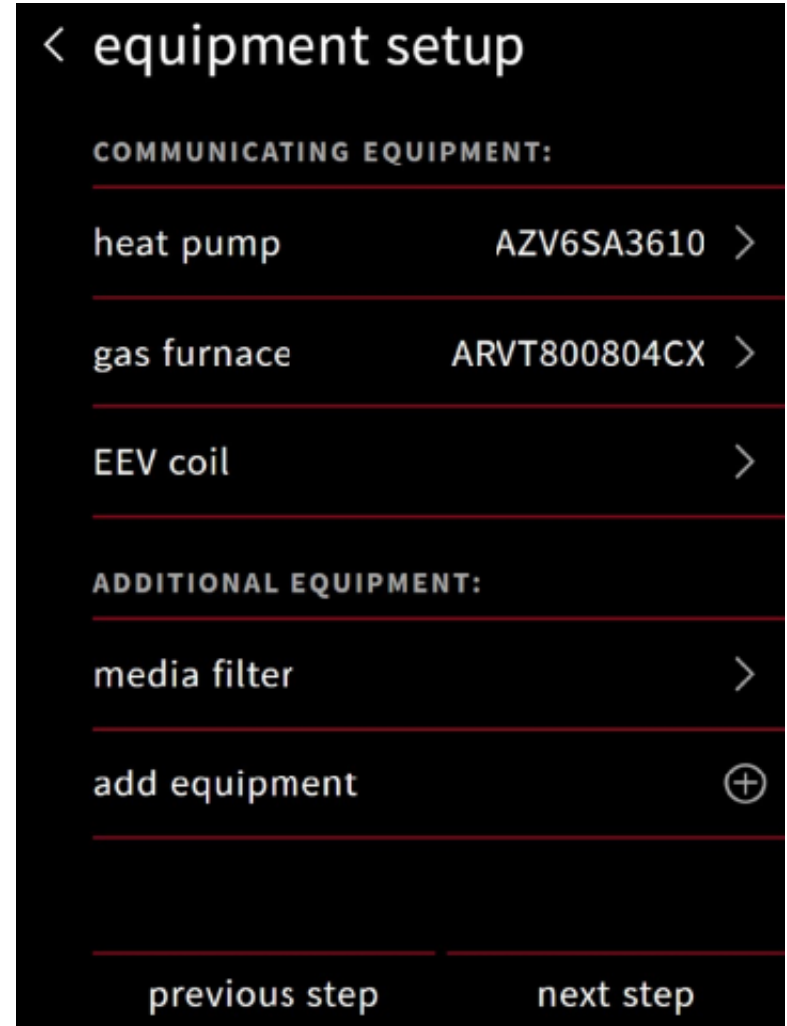

# Scenario #4

## Communication Error at Start-up

- CORRECT!! The wiring between the R and C terminals are crossed
- Fix the wiring connections and check that the thermostat can find the equipment

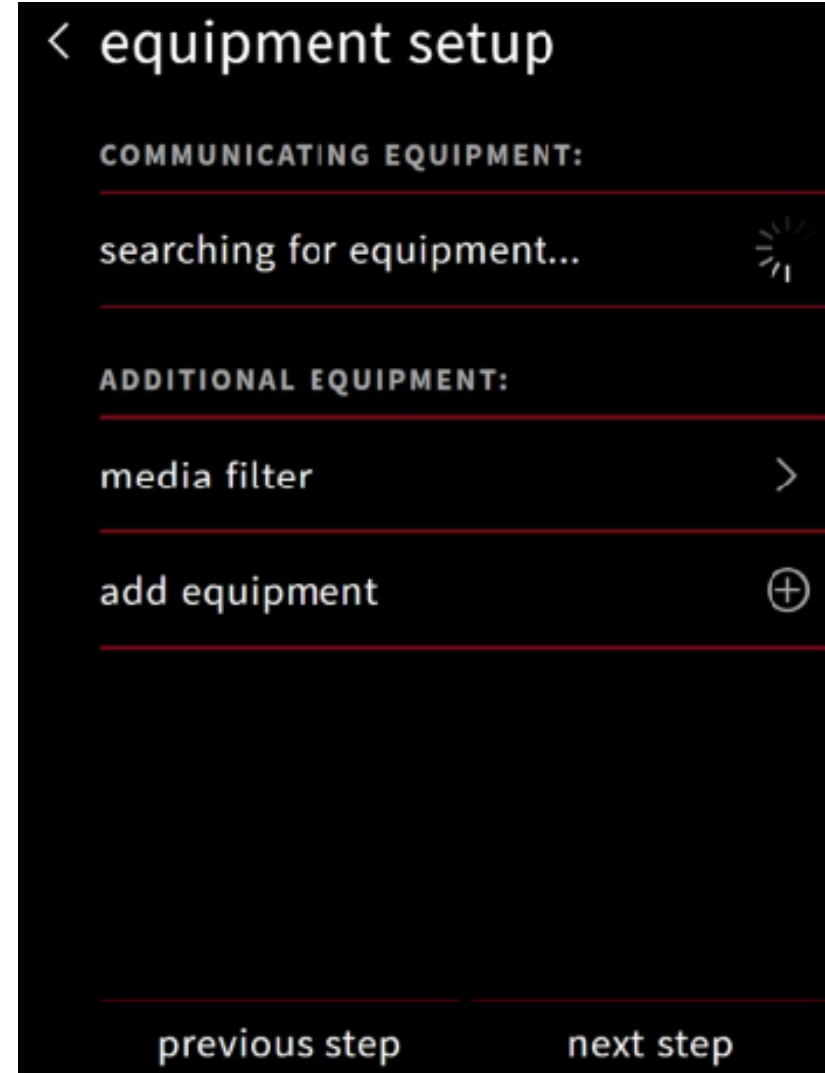

### Amana Brand Smart Thermostat

# Scenario #4

## Communication Error at Start-up

- What can prevent the thermostat from seeing the equipment?
  - Improper wiring voltages
  - Lose, disconnected, or broken wires
  - Improper shared data
  - Faulty PCB
- For more causes, refer to the service manual
